DevSecOps at the Speed of AI

Is a catastrophe brewing?

AI is a Double Edged Sword
AI can find vulnerabilities and create them

AI can uncover a flaws in software that has run for years.

AI can also introduce a flaws in the code we ship today.
In Veracode's 2026 benchmark,
about 44% of AI coding tasks produced code with a known vulnerability.

Would you approve this pull request?

Suppose you ask AI to format a timestamp on a dashboard.

12 lines changed. One new import. Tests pass.

Would you merge it?

glzr.ai
(GLAY-zer)
By DJs, for DJs.

What did that one import bring in?

Six additional packages to format one timestamp.

The application already had a formatter.

Where does the new code run?

What can it access? Who will patch it?

glzr.ai

By DJs, for DJs.

Who fixes what AI finds?

Bank of America added roughly 1,000 contractors for patching work alongside about 3,000 people already working in the area.

If leadership keeps deferring fixes, who has the time and budget to act when discovery accelerates?

What leaders can change on Monday?

- Give each critical fix an owner and time on the roadmap.
- Ask what the codebase already provides before adding a dependency.
- Verify that the fix reached production before closing the finding.
- Turn recurring AI mistakes into tests the next change must pass.

The new scarcity is understanding.

Pick one dependency your team shipped this week.

Why is it there?

What can it reach?

Who owns the fix?
