PLATFORM DAY • AUSTIN 2026

Productization of AI

from an Engineering Leader’s Perspective

From customer friction to a business decision

Bradley Friemel

Customer effort reveals the opportunity

“I know which bounce house. What else makes a great party?”

A busy parent arrives with an idea.
The customer still has to assemble the experience.

Look for a decision that asks too much of the customer.

The user and the buyer both need value

Who	Value to create	Behavior to observe
Parent	Easier party planning	Uses planner, completes order
Merchant	Relevant additions to orders	Enables feature, sees value
Our business	Value from existing revenue	Use becomes sustained demand

INITIAL ESTIMATES 20% order-value uplift 10% improvement in purchase speed

Define adoption on both sides of the B2B2C experience.

A small prototype makes feedback concrete

What must we learn before a full build?

One feasibility question

A working example using realistic context

Ask: “What would make this unusable for a real customer?”

Give each partner a question to answer

Partner	A question worth bringing
Product	Which outcome deserves priority?
CX	Where do customers get confused?
Sales	What would a buyer need to believe?
Customers	Does this fit the way you actually work?

Let their answers change the proposal.

Make the investment decision concrete

Customer problem	Who needs help, and what evidence do we have?
Cost to deliver	Engineering effort, token usage, ongoing iteration
Expected benefit	Merchant outcome and company economics
Requested decision	What should we fund, and what will we learn next?

Make estimates explicit so leadership can examine them.

Commercial choices shape the experience

Commercial choice in this case	Product implication
Base purchase + 20% token markup	Track usage and delivery cost
Token-cost cap turns feature off	Define the experience at the limit
Existing order share averaged 2%	Merchant order value can benefit us too

Map customer benefit, company revenue and delivery cost.

Give AI clear business boundaries

Allow useful variation	Enforce the conditions
Party ideas and combinations	Merchant inventory is real
How the plan is explained	Recommendations respect business rules
Several good answers	Check suggestions against real data

For every condition, name the data and the check.

Tuning needs ongoing ownership

A good demo is the start of testing.

01 Keep representative customer requests

02 Define the conditions each response must satisfy

03 Retest after changes and inspect regressions

Useful reproducibility means consistent requirements.

Help the buyer picture the outcome

One bounce house became a whole party plan.

Tables, chairs, movie screen and a popcorn machine

Merchant-reported anecdote

Conceptual illustration

Use evidence to choose the next step

20%

Initial order-value uplift estimate

~50%

Observed higher average value of AI-assisted orders

Comparison: merchants' historical average order values.
Observational result. It does not isolate the effect of AI.

Agree on the baseline before launch.

YOUR FIRST MOVE

What to look for Monday

Repeated “what should I choose?” questions
Manual planning or explanation
Business data and rules you can use
A measurable customer and business benefit

Find one workflow. Talk with one partner.
Choose one assumption a prototype can test.
